Dear Captain Bush:

Please find enclosed our Final Report in accordance
with Section E.1, Data Item A006, on the above
referenced contract.

Should you have any questions or comments, please
contact the undersigned.

Sincerely,

J. Thomas Harrington
Director of Research

STATEMENT OF WORK PERFORMED AND RESULTS

↙ This study's objectives are (1) to develop the methodology for assessing Disassembly Inspection Reports AND, ~~which would allow, (2)^{to} identification of those items/parts critical to flight safety.~~ ↘

The following reflects Task 1 - Review of Disassembly Inspection Data and Crash Facts.

DIRS

Time Frame for Each Fleet
Jan 73 - Nov 79

<u>Fleet</u>	<u>Number of Data</u>
UH-1	517
AH-1	131
OH-6	61
OH-58	360
CH-47	205

The above data was screened by part number and failure mode, but could not be related to mishap class, which is not available in DIR's.

CRASH FACTS

Time Frame for Each Fleet
June 73 - Nov 79

<u>Fleet</u>	<u>Number of Data</u>
UH-1	5,150
AH-1	1,014
OH-6	131
OH-58	1,439
CH-54	80
CH-47	718

The above data was screened by part number, functional group and mishap class. Maintenance induced cases were eliminated from data. Screening was performed manually for all criteria from hardcopy printouts transmitted by TSARCOM (Appendices A and B).

Appendix A shows the listing by fleet, of the number of failures (highest to lowest) by part number, nomenclature, and number of failures by failure code. This listing was developed from DIR data.

Appendix B shows the listing by fleet, of the number of failures (highest to lowest) by part number, nomenclature, and failures by mishap class. This listing was developed from Crash Facts data. An attempt was made to insure equivalency between the total number

of failures found in the DIR's and Crash Facts, but there are discrepancies due to gaps in data recording, and lack of tear downs resulting from Precautionary Landings.

Concerns raised by data screening and evaluation are:

- 1) Cannot correlate DIR's data with mishap information;
- 2) Cannot identify specific tail number identities associated with specific mishaps due to litigation potential;
- 3) Data not complete, e.g. missing failure codes, part numbers, poor reproduction quality, etc. on specific DIR's and/or in Crash Facts.

Evaluation of the Elements of Task 2:

- 2a) The first step in assessing the magnitude of actual and potential hazards in a system was accomplished by constructing a matrix relating number of failures by functional group to mishap class (See Appendix C for Matrix and Mishap Class definition).

No further update of data was accomplished due to the emphasis on using the DIR Data System for developing criticality. However, as is stated below in this report, relating mishap class, costs, and failure frequency and mode could be the vehicle

for developing a systematic approach for assessing not only magnitude of actual hazards, but also, potentiality of hazards within individual aircraft systems.

For example, in attempting to use mishaps as an indicator of flight safety, DIR's cannot be used, as mishap class is not recorded as Data Input for DIR programs as shown below:

DATA INPUT CARDS FOR DIR PROGRAMS

Card A	<u>Control No.</u>	<u>Date Rec'd</u>	<u>Tail No.</u>	<u>TMS</u>
	<u>Comp. Nom.</u>	<u>PN</u>		
Card B	<u>Control No.</u>	<u>Comp. SN</u>	<u>FMC</u>	<u>Date Rem'd</u>
	<u>TSN</u>	<u>TSO</u>	<u>No. Overhauls</u>	<u>Date Last OH</u>
	<u>OH Activity</u>	<u>Rem. Code</u>	<u>EIR No.</u>	<u>Findings</u>
Card C	<u>Control No.</u>	<u>Failed PN</u>	<u>Fail Code</u>	<u>Report</u>
				<u>Type</u>

Another alternative, however, is the establishment of an integrated DIR/CRASH FACTS System. Of two other alternatives, one would be limited additions of necessary data to the current DIR input or two, establishing a new total information reporting system. The latter, obviously, would be costly in both time and dollars.

Conclusions, drawn by the study group, however, point to the duplication of effort already in the systems(s) and the need, at a minimum, for a

coordinative agent to establish first, the needs of the various components of TSARCOM, and then, establishing the necessary data base and retrieval system to meet those needs. It is strongly felt by the study group that the development of an integrated, agreed upon data base system, with data clearly classified and validated before entry into the system with evergreen procedures, must be accomplished before any rigorous examination of criticality can be considered. This statement relates both to maintenance induced failures as well as material induced.

The November Progress Report also stated that a time series analysis would be developed to indicate trend values for individual systems, along with a relative measure of specific failures to total number of failures. The latter item was accomplished but results were of minimal value. The time series analysis was evaluated, but eliminated from further study due to data limitations.

- 2b) Calculation of associated probabilities for identification of critical components has been limited by data. Two approaches were developed. One using a frequency distribution (See example in Appendix D). The second uses this distribution

along with the matrix developed in 2a and cost data (Appendix E). From this data, an Expected Value of Cost was computed as follows.

If cost can be assumed to be related to safety, then the determination of critical could be narrowed to cost. For example, a total loss accident with bodily injuries or fatalities would certainly show up as a very high cost.

One method that is used is the matrix of median costs (Appendix E) by functional groups and accident classes (similar to the matrix of failures). A cell with a high median cost directs attention to a potentially critical area to be investigated.

Using the matrix relating number of failures by functional group to mishap class (Appendix C) and the matrix relating median cost by functional group to mishap class (Appendix E), we can compute a conditional expected value of median cost of a failure for each functional group. The formula is:

$$E(C/ J=j) = \sum_{i=1}^6 c(i,j)p(i/J=j)$$

for $j = 1, 2, 3, 4, 6, 8, 9, 10, 11, 12, 17, 19$ and 30 . In this formula, i is the mishap class, $J=j$ is the functional group, C is the median cost of

a failure, $c(i,j)$ is the median cost of a failure for mishap class i and functional group j , $p(i/J=j)$ is the conditional probability of the failure leading to a mishap in class i given that the mishap was a result of a problem in functional group $J=j$, and $E(C/J=j)$ is the expected value of median cost of a failure in functional group j .

Using the CH-47 Fleet as an example, we obtained the following results:

<u>J=j</u>	<u>Expected Value of Median Cost</u>
1	$E(C/J=1)=2491(20/37)+0(17/37)= \$1,346.49$
2	$E(C/J=2)=9915(4/5)+0(1/5)= \$7,932.00$
3	$E(C/J=3)=2026200(1/165)+184879(1/165)+14500(2/165)+0(161/165)= \$13,400.48$
4	$E(C/J=4)=3223625(1/159)+157528(3/159)+0(155/159)= \$23,246.60$
6	$E(C/J=6)=0(132/132)= \$0.00$
8	$E(C/J=8)=8472(1/33)+0(32/33)= \256.73
9	$E(C/J=9)=0(37/37)= \$0.00$
10	Cannot be computed at present time because of missing cost data.
11	$E(C/J=11)=0(22/22)= \$0.00$
12	$E(C/J=12)=0(14/14)= \$0.00$
17	$E(C/J=17)=0(2/2)= \$0.00$
19	No functional group 19 failures in CH-47 Fleet.
30	$E(C/J=30)=0(1/1)= \$0.00$

These expected values of median cost of a failure give us a way to rank the functional groups according to cost of failure which we feel is a measure of flight safety.

The rankings for the CH-47 Fleet would be:

<u>Rank</u>	<u>Functional Group</u>
1	Rotor and Transmission
2	Engine
3	Landing Gear
4	Airframe
5	Instruments
6 and above	All other functional groups had \$0.00 Expected Value of Median Cost of Failure except for 10 which could not be computed and 19 which had no failures in the CH-47 Fleet.

We used median cost instead of the mean cost for it is not as affected by outliers as the mean. Also, we preferred median over mode as it always exists and is a more stable measure of location.

As previously stated, however, data limitations, specifically lack of cost data and an inability to retrieve enough data for valid frequency distributions by specific part number, forced a curtailment of this task.

2c) Many of the design features contributing to pilot and maintenance errors leading to mishaps have been corrected thru EIR's and later generation aircraft i.e. the OH-58C, CH-47D, YAH-64 and UH-60A.

Many pilot errors through design features are due to a trade-off in design to save money or weight. Three good examples of this are first, the pilot seats in the OH-58 are not adjustable vertically leading to one fixed setting that must be used by pilots of all sizes which leads to fatigue on long missions. Secondly, the fixed landing light on the same aircraft causes glare under certain conditions; and thirdly, the windshield defroster will not clear the windshield on OH-58's and UH-1's under various weather conditions leading to poor pilot visibility.

Most maintenance errors caused by design features again are caused in many cases by the same kind of trade-offs, for instance:

- 1) Over or under lubed could be solved by using assemblies requiring no lube except at Depot Level.
- 2) Installed Improperly - Should be designed so this cannot happen.
- 3) Torque Incorrect - Use of a system so the assembly could not be safetied if torque is incorrect or

utilize the system of turning the bolt so many flats after resistance to turning is first noticed.

It is further recommended that design trade-offs, because of cost or weight that create reliability and maintainability problems, could be reduced through increased use of Value Analysis and Human Factors Studies as part of the Design package.

- 2d) Identification, ranking and cataloging of failure modes and hazardous conditions are shown in Appendix C. Major problems seem to fall under the following headings:

OH-58

<u>NOMENCLATURE</u>	<u>TOTAL FAILURES</u>	<u>HIGHEST FREQUENCY/ FAILURE MODE</u>
No. 2 Bearing	59	22 Bearing Failure
Spur Gearshaft	35	20 Loose
No. 8 Bearing	17	11 Bearing Failure
Planetary Bearing Assy	13	7 Spalled
Power Turbine Seal	11	10 Carboned

All others less than 11 failures.

UH-1

<u>NOMENCLATURE</u>	<u>TOTAL FAILURES</u>	<u>HIGHEST FREQUENCY/ FAILURE MODE</u>
Power Shaft Support Bearing	24	17 Bearing Failure
No. 4 Bearing	19	9 Bearing Failure
Carbon Seal	17	10 Leaking
Bevel Gear	15	5 Improper Lubrication
Bevel Gear	10	6 Scuffed
Compressor Rotor	15	5 F.O.D.
Compressor Assy	8	3 F.O.D.
Bellows, P-1	13	9 Manufacturer Defect
Bellows, Main	6	2 Leaking
Bearing, Housing	11	8 Worn Excessively
Compressor Blade	11	4 Fatigue Cracks
Engine T53 L13B	10	2 Not determined 2 Rusty

All others less than 10 failures.

AH-1

Engine	11	2 No discrepancy found 2 Eroded
Servo Cylinder	8	4 Improper Maintenance
No. 4 Ball Bearing	8	5 Excess Vibration

All others less than 8 failures.

CH-47

<u>NOMENCLATURE</u>	<u>TOTAL FAILURES</u>	<u>HIGHEST FREQUENCY/ FAILURE MODE</u>
Ball Bearing	12	4 Incorrect Torque
Planet Bearing Retainer	11	4 Worn Excessively
Nut, Plain Round	9	5 Incorrect Torque
Power Shaft Support Bearing	9	4 Grooved
Bearing Assy, Planet Gear	6	6 Bearing Failure

All others less than 6 failures.

OH-6

Gasket, Lube Pump	4	3 Leaks Oil
Spur Gearshaft	3	3 Loose

All others less than 3 failures.

CH-54

Insufficient Data.

NOTE: Each Nomenclature may have more than one part number - See DIR Listing.

As can be seen, even though maintenance induced failures were supposed to have been culled from data base; when failure code was evaluated, many of the hazardous conditions could be traced directly to maintenance procedures.

2e) In determining conformance of the parts to quality and disclosing any major quality problems, we have noted fifty quality defects as outlined below. This is from DIR Data for all fleets. Two very major quality problems are first, the Bellows Assy in the UH-1 Fuel Control; and secondly, ball and roller bearings. We have also noted eighty-nine maintenance defects for all fleets.

UH-1

2f) In identifying areas which require technological advances to improve reliability and maintainability, quality control of bearings has been a problem not only in Army Aviation; and is indeed one that requires new technology.

The Rotor Systems continue to be a problem; however, the new systems used on the Blackhawk and latest model of the CH-47 should eliminate most of the problems.

The next generation of engines with improvement in the fuel control should help especially when the Army adopts the Digital Electronic Fuel Control which should incorporate diagnostic capabilities.

Appendices A and B do identify in more specific detail those areas, (either because of the nature of the failure and/or the resultant type of mishap), that could be considered candidates for further study.

This completes the evaluation of the tasks and results assigned under the Statement of Work of Delivery Order DAAJ01-77-A-0012-0006 (P6D) under BOA DAAJ01-77-A-0012 (P6D).

APPENDIX C

APPENDIX C

AIRCRAFT ACCIDENT - damage to one or more aircraft which occurs between the time the engine(s) is (are) started for the purpose of commencing flight until the time the aircraft comes to rest with all engines and propellers or rotors are stopped.

AIRCRAFT MISHAP - any accident or occurrences which may or may not result in aircraft damage.

CLASS 1 - Major Accident (Total Loss) - an aircraft accident is classified major, total loss, when the aircraft is destroyed and determined uneconomically reparable. The damage sustained is equal to or in excess of the criteria cited in Table 2-1 of AR 385-40; or damage in which a major component is destroyed/damaged beyond economical repair at any level of maintenance.

CLASS 2 - Major Accident (Substantial Damage) - an aircraft accident is classified major, substantial damage, when the aircraft is reparable, and the total direct man-hours required to remove, repair, and replace damaged component(s) equal or exceed the man-hours set for that particular type and model of aircraft in Table 2-2 of AR 385-40.

- CLASS 3 - Minor Accident - damage which is less than major damage, but is equal to or exceeds the criteria for minor damage cited in Table 2-2 of AR 385-40.
- CLASS 4 - Incident - aircraft damage which is less than the criteria for minor damage cited in Table 2-2 of AR 385-40.
- CLASS 5 - Forced Landing - a landing necessitated by failure or apparent impending failure of engines systems or components which makes continued flight impossible, and which did not result in damage.
- CLASS 6 - Precautionary Landing - a landing necessitated by failure of apparent impending failure of engines, systems of components which makes continued flight inadvisable, and which did not result in damage.
- CLASS 7 - Human Factors
- CLASS 8 - Ground Incident
